### LightScribe Overview

LightScribe is a disc-labeling technology that lets you laser-etch a label directly on your disc. Creating professional-looking discs is easy: burn your disc, flip the disc over, and then burn your label onto the disc. The same drive that burns your data, burns your label.

A LightScribe-enabled DVD drive uses a laser to burn an image into the coating on the label side of a LightScribe disc. The LightScribe labeling system has no ink to smear, no paper to curl, and no sticky adhesive to cause problems.

To create a LightScribe label, you need:

1. A LightScribe-enabled DVD drive in your computer or LightScribe-enabled DVD writer. LightScribe-enabled computers or writers typically have the LightScribe logo  or the word "LightScribe" displayed on the drive tray or computer itself.
2. LightScribe-supported disc-labeling software. This is often included with your LightScribe-enabled computer or DVD writer. A list of available software packages is [here](#).
3. LightScribe System Software. This is similar to a driver and is usually included with your LightScribe hardware. The latest update is available [here](#).
4. Specially coated LightScribe CDs or DVDs (sold separately at major retail stores or online). LightScribe discs are identified by the LightScribe logo  on the media package.

Refer to <http://www.lightscribe.com/> for more details on LightScribe.
